

To be discussed w/r to ICD v0.10

1. § 3.5.2.2

"The SignedServiceMetadata structure holds both a ServiceMetadata structure and the corresponding signature by the receiver to allow the user (or any other user) verifying the authenticity of the information provided by the SMP by using the public key of the receiver before sending him any document" –

→ does this still apply after the analysis of CR from OASIS TC (can we disclose it)?

2. §4.1.2

To be updated according to feedback from OASIS TC: use "lax" –

→ Can we already disclose it in this doc?

3. §4.4.2

"eHealth will host its SMP instance" –

→ What does this mean? Will it be an authority different from DIGIT?

4. §4.4.2

Regarding this note from the previous comments: "This document is a generic one. This choice is left open to the various future implementations and therefore not specified in here."

→ maybe include it in the document?
